> Merging datasets practical

Problem

- We have a large dataset on Blackboard called **MoreData**
- Load the dataset into a data frame. Call the data frame **new_managers_data**
- Show the structure of this data
- Export only data of interest – NB dataset structure must match data in frame for merging ie it has to be in the same format as managers data frame
- Create blank attributes for new_managers_data and assign **NA** to them
- Convert the date field in new_managers_data
- Combine both datasets using **rbind()** function
- Apply categorising function to the new_managers_data
